Quantum simulation with fermions in a quantum gas microscope

Would you like to explore the intriguing world of quantum physics? We are looking for **motivated PhD students** to join our team.

Atomic gases at temperatures close to absolute zero give the unique opportunity to study quantum many-body phenomena in the laboratory under controlled conditions.

Our team has just completed the construction of a quantum-gas microscope which allows us to image fermionic potassium atom by atom, lattice site by lattice site. This exciting new tool will open the path to the study of strongly correlated fermionic quantum systems in optical lattices with unprecedented insight into their local properties.

Interested in joining us?
